***Reasons for Allowance***

1. The following is an examiner's statement of reasons for allowance: None of the references cited or the art searched disclose or teach alone or in combination a means for determining the optimum strategy for controlling computer emissions from an electric power generating plant using historical data for both power and corresponding pollutants, using real time data on power and pollutants, predicting future power generation using historical and real time data, calculating baseline emission rates for the present and future using present power and predicted future power requirements, and displaying emission rates for the future based upon the time series analysis.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."

***Relevant Prior Art***

2. The prior art made of record and not relied upon is considered pertinent to applicant's disclosure.

Orr (5831876) discloses a method for monitoring air pollution, which involves collecting real time and historic data within an altitude of interest above the ground, and presenting a multidimensional image of pollutants present. The method involves acquiring factual natural and man-made air quality information on a real time basis, and identifying subject matter of the real time factual information. The information is ingested and stored, and the pre-existing factual air quality information of selected subject matter is retrieved from a source.

Rollins (6230480) discloses a system and method for increasing the output of a power plant while meeting the requirements to obtain an air permit which dictates the allowable levels of specific pollutants that a plant may emit.

Art Unit: 2125

VonDrasek (6244857) discloses methods and apparatus to control burner combustion by comparing the predicted and actual burner power using a model that predicts the power within  $\pm 5\%$ . The detection of pollutants such as Nox is directly or indirectly monitored. However, it is difficult to quantify these pollutants because the observed signal is both temperature and concentration dependent, but gross changes in the observed signal levels can be monitored.

Lang (6522994) discloses a method and system for quantifying a fossil fueled thermal system so that the relationship of variations in the operating parameters to the inputs and outputs of the power plant thermal system may be understood. This understanding, in turn, permits the operation of the power plant thermal system to be optimized for thermal efficiency and pollution minimization.

Uekusa (JP406193400A) discloses a method of predicting the degree of air pollution over a period of time using a recurrence technique using a VI value measuring means.
